

I'm not robot!

If you previously used Java (JRE) on your PC, chances are you still have some older version available somewhere on your system or at the very least some residual files. In this case, you might want to remove the old Java files before you proceed with deploying the latest version. You can tackle this situation in two different ways: Use the Java Uninstall Tool Remove Java manually, like any other program 1. Using the Java Uninstall Tool This tool can come in very handy, as it automates the process of identifying and removing Java from your PC completely. There's no need to search for remaining files, as this utility can take care of everything for you. You will see the versions of Java that the tool detected and wants to remove It's possible to select all Java versions to remove or just some of them You can use it to detect and uninstall Java versions 1.4.2 and higher This tool detects only Java versions that were deployed through the official installer, and not bundled editions It comes in especially handy if you've installed several editions of JRE on your PC and have no idea how to get rid of them all. You can download the Java Uninstall Tool from here. 2. Uninstalling Java manually It's not necessarily more complicated to remove Java manually, but there are a bunch more steps you need to take. Additionally, if you have multiple versions available on your system, you might miss some of them, rendering the uninstallation process ineffective. With that in mind, here's how to uninstall JRE manually on Windows 10: Click the Start button Choose Settings from the Start menu Press the Apps button in the Settings window Locate the Java edition you want to uninstall and click it Click the Uninstall button Wait for the process to finish That's all. We can't stress this enough, but make sure you have removed every trace of old JRE files before you install the latest Java version on your Windows 10 PC. Trust us, it will save you a lot of hassle. How to install Java (JRE) on Windows It's critical that you always have the latest stable version of Java (JRE) if you want to avoid incompatibility issues, runtime errors, or even crashes. We'll show you how to install the latest Java (JRE) version on your Windows 10 PC. Follow these steps: Go to the Java JRE download page Check the recommended version at the top of the page Scroll down to the Windows section Choose the appropriate installer version for you Wait for the download to complete Double-click the installer executable Follow the on-screen installer instructions The installation part is not exactly difficult since all the configuration you need to do is choosing a destination path on your PC. However, you must be careful to choose the right installer from the website. Currently, there's an online installation tool, and two offline ones (one for 32-bit browsers, and another one for 64-bit ones). Note: if you use 32-bit and 64-bit browsers on the same computer and want to use Java on each of them, you need to install both 32-bit and 64-bit versions of Java (JRE). FAQ: Learn more about Java To put it shortly, Java is a great programming language that is used in a wide range of fields. You need to download its runtime environment (JRE) if you want to be able to run Java-based applications on your PC. After you install it on your computer, Java will offer to keep itself updated automatically. Alternatively, you can set it to notify and remind you of updates without deploying them automatically, or you can download updates manually from the official website. How can I enable Java in Chrome? Starting with version 42, you can no longer use Java in Chrome, since the browser no longer supports NPAPI (Java applet technology). You can still use it on versions 42 and earlier, but there's really no point in doing so. Today we will learn how to download and install Java on Windows 10. If you are new to Java programming then this is the first step you need to perform. Until unless your java Windows 10 environment is set up properly, you will not be able to develop Java programs and run them successfully. How to Install Java in Windows 10 Installing Java on Windows 10 is really easy, just follow the steps as follows: The first step is to download Java installation files from Oracle's website. Java 9 is the latest version, so go to this link and accept the license agreement. Then click on the download link for windows as shown in the below image and save the file. Note: If you are trying to install Java 8 or earlier, then you need to know whether your Windows 10 is 32-bit or 64-bit. It's because there are two different installers for Windows as seen in this link for Java 8 binaries. If your Windows 10 is 32-bit OS then download Windows x86 exe file, else download Windows x64 exe file. If you are not sure of the Windows version, you can easily check it in Settings > System Settings > About. 10. ### Java Windows 10 installation steps Next step is to run the downloaded Java installer executable file. Just double click on it and follow the steps. Most of the time you don't need to check anything and go with default selection, below are images from my installation screens. They might differ a little bit based on your java version installation but mostly it's the same as usual. 17. ### Java on Windows 10 Version Check Finally, we have to check if Java is installed properly or not. We can do that by using java -version command in command prompt, as shown in below image. Note: In older java versions and other windows operating systems, you need to set up two environment variables to get it working. Go to System Properties (Right Click on My Computer and select Properties) > Advanced > Environment Variables. In the popup window, System variables section, click on New button and add a variable with the following details: Name: JAVA_HOME Value: C:\Program Files\Java\jdk1.6.0_25 After this, you need to edit the Path variable already present there. Just select the Path variable and click on the Edit button. In the popup window value section, go to the end and add the following: ;C:\Program Files\Java\jdk1.6.0_25\bin (The colon is used as a delimiter, so don't miss that!) Now your setup is done and you can check it by opening a command prompt and running command java -version. In Windows 10 and Java 9, we don't need to do these manually. Java installer takes care of that and you can check environment variable Path value, as shown in the below image. Note that we don't need to set the JAVA_HOME variable. 27. ### Download and Install Java IDE This is an optional step but highly recommended. If you want to get things done easily, you should install either Eclipse, IntelliJ Idea or NetBeans IDE that helps a lot in development of Java programs. Just download and install it with executable file, they are straight forward. That's all for downloading and installing java on windows 10. Let me know if you face any issue in setting up the environment. What's after installing Java Now you are ready to learn java programming, go through the articles on core java tutorial and learn java programming step by step. Note: A few years back, I made this video to install java 8 on windows 10. Steps are still almost the same so you can watch it to get more ideas about it. Also if you want to have multiple java versions and want to switch between them easily, then go through this short 2-minute video.
